

SHRUTI DEWASKAR

Hoshangabad, Madhya Pradesh - 461001 | +91 9479382188
shrutidewaskar2701@gmail.com | [Github/Shruti Dewaskar](https://github.com/ShrutiDewaskar) | [LinkedIn](https://www.linkedin.com/in/shrutidewaskar)

EDUCATION

Vellore Institute of Technology - Bachelor of Technology (CGPA : 8.90)

2023-2027

TECHNICAL SKILLS

Product: User Problem Discovery • Product Analytics • Root-Cause Analysis • KPI Thinking • Feature Prioritization • Prototyping • Experimentation • User-Centric Problem Solving • Product Documentation

Analytics: Excel/Google Sheets • SQL • Python • Pandas • NumPy • Matplotlib • Data Visualization • Exploratory Data Analysis

AI / GenAI: LLMs • Gemini • Vertex AI • Prompt Engineering • RAG • AI Agents • Machine Learning • Computer Vision

Technical: Next.js • React • TypeScript • JavaScript • FastAPI • Django • REST APIs • PostgreSQL • Supabase • Firebase

Tools: Git • GitHub • Streamlit • Vite • Tailwind CSS • Google Cloud

Ways of Working: Structured Problem Solving • Cross-functional Collaboration • Technical Communication • Agile Development • Rapid Prototyping • Ownership

Customer Experience • Product Analytics • Personalization • Growth • Consumer Funnels • Pricing & Promotions • User Behaviour • AI Products • Data-Driven Decision Making

WORK EXPERIENCE

amasQIS.ai — AI Engineering Intern

April 2025 – September 2025

- Translated a real-world workplace safety problem into an AI-based computer-vision solution for PPE detection, working from problem definition through prototype and model evaluation.
- Analyzed model outputs and failure cases to identify where the solution performed poorly, iterating on the approach to achieve 95% accuracy.
- Evaluated performance using measurable outcomes and communicated technical results in terms of their practical impact on the intended use case.
- Worked through an iterative build-test-improve cycle, strengthening skills in root-cause analysis, experimentation, and solution validation.

PROJECTS

AQI Data Analytics and Prediction - AI Hiring Hackathon | Python, Pandas, Numpy, Matplotlib, Scikit-learn

[DEMO LINK](#)

- Analyzed an air-quality dataset to understand user-relevant environmental patterns, identify relationships between variables, and determine which factors could improve prediction.
- Performed exploratory data analysis, feature analysis, data cleaning, and visualization to move from raw data to evidence-backed insights.
- Conducted feature exploration to identify additional signals available within the dataset and evaluated their potential contribution to model performance.
- Used a structured observe → analyze → hypothesize → test approach rather than treating model training as the end goal.
- Presented analytical findings and model outcomes clearly, translating technical observations into understandable conclusions.

StackAudit - AI Stack Intelligence Platform | Next.js, TypeScript, Supabase, AI

[DEMO LINK](#)

- Identified the business problem of organizations paying for underutilized AI tools and designed a product around usage visibility, pricing intelligence, and potential savings.
- Structured the product around key user questions: What tools are being used? What are they costing? Which tools are underutilized? Where can savings be created?
- Designed dashboard workflows that transform raw subscription and usage information into actionable product recommendations and decision-support metrics.
- Defined product outputs around measurable business outcomes including tool utilization, unnecessary spend, and estimated savings.
- Used rapid prototyping to test how complex usage and pricing information could be presented as simple, actionable insights.

ArthAI — AI Financial Operating System | Next.js, FastAPI, PostgreSQL, Supabase, Gemini, GCP

[DEMO LINK](#)

- Identified a core user problem: financial information is often fragmented across accounts and difficult to translate into clear, actionable decisions; designed ArthAI around a persistent financial reasoning layer.
- Broke the ambiguous problem into smaller components including user intent, financial context, memory, business rules, scenario simulation, and recommendations.
- Designed an onboarding flow to capture relevant user context before generating recommendations, ensuring the product responds to the user's actual financial situation rather than generic rules.
- Built an AI intelligence pipeline that uses GenAI/LLMs to interpret user intent, combine contextual information, and generate explainable recommendations.
- Designed a Financial Health Score and recommendation framework to convert multiple financial signals into simple, decision-oriented outputs.
- Developed and iterated on end-to-end prototypes across frontend, backend, database, authentication, and AI layers, validating product flows from problem → prototype → implementation → user experience.
- Applied business rules and scenario simulation to help users evaluate potential financial decisions, connecting product functionality to measurable user outcomes and decision support.

ACHIEVEMENTS AND LEADERSHIP ROLES

- Smart India Hackathon 2025 — Runner-up: contributed to an AMU rates tracking platform, collaborating on a technology solution to a real-world information and usability problem.
- Participated in AI, management, and case-study competitions, developing structured approaches to ambiguous business and analytical problems.
- Participated in rapid-build hackathons requiring problem understanding, data analysis, prototyping, prioritization, and presentation under time constraints.
- Attended Yuva Sangam Phase VI - Delegate from Madhya Pradesh, visited Jharkhand for an immersive experiential tour.
- Completed Google Cloud Data Analytics Certification
